

01 THE CHALLENGE

Every gateway we defend must listen on a public address, and anything that listens can be found, flooded and exploited. The commercial answer moves control into a vendor cloud you cannot audit or keep sovereign.

EXPOSED

Public gateways are scanned around the clock and breached before patches ship.

DEPENDENT

A foreign cloud holds the keys to your network, outside your jurisdiction.

BLIND

IP-to-IP logs cannot prove who did what, and they can be rewritten.

02 HOW ZEROPORT WORKS

01

IDENTIFY

Nostr

Every device carries a cryptographic identity on a quorum-signed roster.

02

MEET

Tor onion

Peers with no public address introduce themselves privately. Seconds only.

03

CONNECT

WireGuard

A direct encrypted tunnel forms. Tor leaves the path. Native speed.

04

GOVERN

Console

Every flow authorized by policy, attributed to a person, and logged.

THE MOMENT THAT PROVES IT

Tor introduces the peers in seconds, then WireGuard carries the traffic directly: **384 ms > 8 ms**

03 WHY IT IS SAFE

No single point of betrayal

Enrolling a device needs a 2-of-3 quorum of officers. Revoking needs only one.

Access that expires by itself

Authorization is a short lease. A lost or offline device loses access on its own.

An audit you can prove

Hash-chained, publicly anchored, and mirrored to your SIEM in real time.

04 IN THE FIELD

- Link directorates, police sites and border posts with no public surface to scan.
- Officer tablets whose access dies with the device the moment it is lost.
- Critical national systems reachable only by enrolled, policy-authorized nodes.
- Seasonal command access for Hajj and Umrah, revoked the instant it ends.
- Every relay hosted inside the Kingdom. No foreign coordinator.

<https://zeroport.vercel.app/>

Scan the public IP and find nothing. Connect anyway. Revoke and watch it die in seconds.

Independent hackathon proposal. Not an official Ministry of Interior publication.
